## 01\_Bootstrap Validator入门案例

- Bootstrap Validator数据校验就是表单验证。友好的错误提示能增加用户体验。
- jQuery form validator for Bootstrap,从描述中我们就可以知道它至少需要jQuery、bootstrap的支持。
- 导入相关组件

```
<link rel="stylesheet"
href="${pageContext.request.contextPath}/bootstrap/css/bootstrap.css"/>
<link rel="stylesheet"
href="${pageContext.request.contextPath}/dist/css/bootstrapValidator.css"/>

<script type="text/javascript"
src="${pageContext.request.contextPath}/bootstrap/js/jquery-3.2.1.min.js"></script>
<script type="text/javascript"
src="${pageContext.request.contextPath}/bootstrap/js/bootstrap.js"></script>
<script type="text/javascript"
src="${pageContext.request.contextPath}/dist/js/bootstrapValidator.js"></script>
<script type="text/javascript"
src="${pageContext.request.contextPath}/dist/js/bootstrapValidator.js"></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></scr
```

• 如果想对某一个字段添加验证规则,需要div(class="form-group")包裹,input标签必须有 name值,此值为验证匹配的字段。其实就是要符合bootstrap表单结构

```
<form id="myForm" method="post">
   <label>账户</label>
   <div class="form-group">
       <input type="text" name="username" placeholder="请输入账户"/>
   </div>
   <label>密码</label>
   <div class="form-group">
       <input type="text" name="password" placeholder="请输入密码"/>
   </div>
   <label>确认密码</label>
   <div class="form-group">
       <input type="text" name="repassword" placeholder="请确认密码"/>
   </div>
   <label>邮箱</label>
   <div class="form-group">
       <input type="text" name="email" placeholder="请输入邮箱"/>
   </div>
   <div class="form-group">
       <input id="btn" type="submit" value="注册"></input>
   </div>
</form>
```

• 使用is添加验证

- 。 账户
  - 账户由英文小写字母、数字组成;长度为8到10之间
- 密码
  - 账户由英文小写字母、数字组成;长度为6到8之间;不能和账户相同
- 。 确认密码
  - 规则和密码一样,必须要和密码一致
- 。 邮箱
  - 满足邮箱规则

```
$(function () {
   $("#myForm").bootstrapValidator({
       // 默认的提示消息
       message: 'This value is not valid',
       // 表单框里右侧的icon
       feedbackIcons: {
           valid: 'glyphicon glyphicon-ok',
           invalid: 'glyphicon glyphicon-remove',
           validating: 'glyphicon glyphicon-refresh'
       },
       fields: {
           username: {
              message: '账户格式错误',
              validators: {
                  notEmpty: {
                       message:"账户不能为空"
                  },
                  stringLength:{
                      min:8,
                      max:10,
                      message:"账户长度为8到10之间"
                  },
                  regexp: { //正则表达式
                      regexp: /^[a-z0-9]{8,10}$/,
                      message:"账户由英文小写字母、数字组成"
                  }
              }
           },
           password: {
              message:"密码格式错误",
               validators:{
                  notEmpty:{
                      message:"密码不能为空"
                  },
                  stringLength: {
                      min: 6,
                      max: 8,
                      message: "密码长度为6到8之间"
                  },
                  regexp:{
                      regexp:/^[0-9a-z]{6,8}$/,
                      message:"密码由数字组成"
                  },
                  different:{
```

```
field:"username",
                     message: "密码不能和用户名相同"
                 }
              }
           },
           repassword:{
              message:"密码格式错误",
              validators:{
                  notEmpty:{
                     message: "密码不能为空"
                  },
                  stringLength: {
                     min: 6,
                     max: 8,
                     message:"密码长度为6到8之间"
                  },
                  regexp:{
                     regexp:/^[0-9a-z]{6,8}$/,
                     message:"密码由数字组成"
                  },
                  identical:{
                     field: "password",
                     message: "两次密码不一致"
                  }
              }
           },
           email: {
              validators: {
                  notEmpty: {
                     message: '邮箱地址不能为空'
                  },
                  emailAddress: {
                     message: '邮箱地址格式有误'
              }
           },
       }
   });
})
```
